SECURDENCY AUDIT CONCLUSION	0

## INTRODUCTION

CoinMercenary provides comprehensive, independent smart contract auditing.

We help stakeholders confirm the quality and security of their smart contracts using our comprehensive and standardized audit process. Each audit is unbiased and verified by multiple reputable auditors.

The scope of this audit was to analyze and document the Securrency platform contracts.

This audit provides practical assurance of the logic and implementation of the contracts.

## **AUDIT METHODOLOGY**

CoinMercenary audits consist of four categories of analysis.

## **Design Patterns**

We first inspect the overall structure of the smart contract, including both manual and automated analysis.

The design pattern analysis checks appropriate test coverage, utilizes a linter to ensure consistent style and composition, and code comments are reviewed. Overall architecture and safe usage of third party smart contracts are checked to ensure the contract is structured in a way that will not result in future issues.

#### **Static Analysis**

The static analysis portion of our audit is performed using a series of automated tools, purposefully designed to test the security of the contract. These tools include:

- Manticore Dynamic binary analysis tool with EVM support.
- Mythril Reversing and bug hunting framework for the Ethereum blockchain.
- Oyente Analyzes Solidity code to find common vulnerabilities.
- **Solgraph** DOT graph creation for visualizing function control flow of a Solidity contract to highlight potential security vulnerabilities.

Data flow and control flow are also analyzed to identify vulnerabilities.

#### Manual Analysis

Performing a hands on review of the smart contract to identify common vulnerabilities is the most intensive portion of our audit. Checks for race conditions, transaction-ordering dependence, timestamp dependence, and denial of service attacks are part of our standardized process.

#### **Network Behavior**

In addition to our design pattern check, we also specifically look at network behavior. We model how the smart contract will operate once in production, then determine the answers to questions such as: how much gas will be used, are there any optimizations, how will the contract interact?

#### **Contracts Reviewed**

On February 7th, 2019 using git hash 1bbb5c620668c54d215cdd961c60fa4cd28c5b03, the contracts from the repository located below were reviewed.

## https://github.com/Securrency/EthereumSmartContracts

In addition to the contract files, unit tests and the setup process were reviewed as well.

#### Remediation Audit #1

On February 25th, 2019 using git hash c1090858af3bb19e94bb82c605ea8dc302ccad17 the contracts from the repository located below were reviewed.

### https://github.com/Securrency/EthereumSmartContracts

In addition to the contract files, unit tests and the setup process were reviewed as well.

# **AUDIT SUMMARY**

The contracts have been found to be free of security issues.

## **Analysis Results**

	Initial Audit	Remediation Audit #1
Design Patterns	Passed	Passed
Static Analysis	Passed	Passed
Manual Analysis	Updates Recommended	Passed
Token Allocation	Passed	Passed
Network Behavior	Passed	Passed

### **Test Results**

• Unit test coverage available.

## **Explicit Vulnerability Check Results**

Known Vulnerability	Results
Parity Multisig Bug 2	Not vulnerable
Callstack Depth Attack	Not vulnerable
Transaction-Ordering Dependence	Not vulnerable
Timestamp Dependency	Not vulnerable
Re-Entrancy Vulnerability	Not vulnerable
Proxy and Buffer Overflow	Not vulnerable

## **ISSUES DISCOVERED**

Issues below are listed from most critical to least critical. Severity is determined by an assessment of the risk of exploitation or otherwise unsafe behavior.

#### **Severity Levels**

- Informational No impact on the contract.
- Low Minimal impact on operational ability.
- Medium Affects the ability of the contract to operate.
- **High** Affects the ability of the contract to work as designed in a significant way.
- **Critical** Funds may be allocated incorrectly, lost or otherwise result in a significant loss.

#### **Issues**

## SC-1 / High: pushNewCATApp should use the onlyApplicationRegistry modifier

Present in ACATRStorage.sol, line 98

#### Explanation

The pushNewCATApp function is open for anyone to call. This function should be restricted to onlyApplicationRegistry(msg.sender).

#### Resolution

Resolved in f20d2dd2382379280b1429781f2cb2e63b2d6f07.

## SC-2 / Low: Function named isRegistredApp should be named isRegisteredApp

Present in ApplicationRegister.sol, line 180

#### Explanation

The function named isRegistredApp contains a typo, and should be "isRegisteredApp".

## Resolution

Resolved in 6df898ff3019b653b79736c7a100cfb06f501cec.

# ${\it SC-3 / Low: emitCreatedRole should use only PermissionModule modifier}$

Present in PMRolesManagerStorage.sol, line 113

## **Explanation**

The emitCreatedRole function is open for anyone to call. This function should be restricted to onlyPermissionModule(msg.sender).

## Resolution

Resolved in baa0fc9b21771ffbbce070e6809f9b75c66b8929.

## SECURRENCY AUDIT CONCLUSION

February 25th, 2019

CoinMercenary provides comprehensive, independent smart contract auditing.

We help stakeholders confirm the quality and security of their smart contracts using our comprehensive and standardized audit process. Each audit is unbiased and verified by multiple reputable auditors.

The scope of this audit was to analyze and document the Securrency platform contracts. The audit provides practical assurance of the logic and implementation of the contracts.

CoinMercenary has reviewed the Securrency platform contracts and found them to be free of security issues and logic errors.

The audit began on February 7th, 2019, ending on February 25th, 2019. One 'high' issue and two 'low' issues were documented. All issues have been resolved.

Working with the Securrency team has been a pleasure and we look forward to seeing their continued success.

Sincerely

JONATHAN GEORGE, Senior Auditor
